Residents' evaluations of health information exchange for a neighborhood health system. The health information exchange (HIE) for a community hospital located in the inner-city area of Chicago, IL was evaluated using an AID-S framework. We sought to understand residents' perceptions of HIE for a neighborhood health system and whether residents' opinions of HIE were associated with their own or their family's access to care at the health system. The AID-S framework was used to explore residents' perceptions of the strengths and weaknesses of the HIE system. Additionally, a pretest and post-test survey was used to evaluate whether there was any change in residents' perception of the strengths and weaknesses of the HIE system. We interviewed 42 residents at the community health center and used a pre/post-test questionnaire to evaluate residents' perceptions of the HIE system. The most commonly reported strength was that the HIE system helped them to connect with other providers to obtain their information. The most commonly reported weakness was the system's inability to provide information. Perceptions of HIE improved for the group from pretest to post-test and these perceptions were associated with their own access to care and their family's access to care at the health system. Our study was limited by being a single-site and using a small sample. We successfully implemented a neighborhood health system-wide HIE and residents' perceptions of HIE were positive. HIE is an important element of the electronic health record. This type of system can help physicians provide better care and can be of benefit to all patients. The first steps in developing a successful HIE implementation are to assess the needs of the community, provide appropriate education, and communicate expectations.[Unremarkable brain magnetic resonance imaging with abnormal evoked potentials in two patients with rheumatoid arthritis].
