Understand Photoshop Photoshop is a vector-based image creation program with a light-and-dark-style layer-based editing system, similar to that of the GIMP. The _raster_ (pixelated) nature of your images enables you to make changes to the image, such as cropping, color alteration, and so on, using the program's tools, even if the image is only a few pixels in size. But if you work with a pixel-based editor, you can only make changes by cutting and pasting pixels, for example. A raster image is the typical output of digital camera sensors or scanners. Vector-based images (made up of curves, shapes, and lines that describe the shape of the objects in an image) contain the actual information about the image. Vector-based images usually have a single file format. When you create a raster image, you normally get a raster image as the output. If you save a raster image in a format such as JPEG or TIFF, you're saving it in a pixel-based format. A raster image can be created by using a scanner or a digital camera to capture an object. When you scan an object or photograph a scene, the output image is technically a raster image, but you can't look at the image. To make sense of it, you have to convert it to a vector-based image. Converting a raster

The aim of the research is the development of an instrumentation system for the endoscopic measurement of specific absorption rate (SAR) in large dielectric body organs. The objective of the Research Plan is to demonstrate the feasibility of producing this system, which is essential for eventual application in the area of microwave hyperthermia. The dielectric properties of tissue are complex and non-uniform but are sufficiently constant over the frequency range of interest (0.1 to 100 Mhz) so that an approximate measure of the frequency dependence of the SAR may be obtained from knowledge of the dielectric parameters of the organ and the power density incident on it. This will be accomplished in three steps. (1) The dielectric properties of the organ will be determined with a phase sensitive technique. (2) A standard probe will be designed that is capable of measuring these properties without perturbing them. A finite difference equation will be written that will solve for dielectric parameters and estimate the SAR, and a good fit to the equations will be achieved by minimizing the difference between the calculated and measured parameters. (3) A probe capable of delivering constant power density in an organ of interest will be designed and built. Initial measurements of these constants will be made in a phantom. Successful completion of this phase of the project will allow an estimate of the SAR of an organ of interest to be made with a precision of about 10%, an order of magnitude improvement in the accuracy of currently available methods.Date Country Sites Region Africa Arab States Asia and the Pacific Europe and North America Latin America and the Caribbean Since the brutal and potentially deadly spring floods occurred in Pakistan, a number of photos and

videos of corpses lying in streams have been circulating on the internet. One of the most disturbing photos that circulated among internet users was that of a drowned child whose body was photographed in the Naur River. The film was taken in Multan, Pakistan, on 10 May 2010. The photograph was uploaded by a man named Hafeez Chaudhry in May. It was originally uploaded to Facebook. My name is Michael Sprinker. I will be writing mainly about contemporary Art, whilst also posting other art that I come across, along with my personal style and the odd event and exhibition that I attend or organise. On this

Note There is more than one way to use the Pen tool. When you select the Pen tool, you can create a line, a path, or a closed polyline. You can also create a close path, and have a Pen tool option show up on the toolbox. A default Pen tool is also available when the Pen tool icon is selected on the toolbox. In the figure, the Pen tool is showing the Pen tool option and it also shows the Pen tool icon. The Pen tool provides a wide array of features. You can either work from the freehand option or you can use the drawing mode. You can also enter edit mode, and then you can work with either paths or pixels. Most of the time, we will choose the freehand option. To select the freehand option, simply click and hold on a path or an area, and then select the Pen tool from the toolbox. Your cursor turns into a regular pen icon. If you need to create a path, just click once on the canvas area. To enter edit mode, hold down the SHIFT key and click. To create a

close path, hold the SHIFT key down and click once. All the next movements will be restricted to the close path. If you are not sure whether you have selected the freehand or the drawing mode, just look at the mode selected in the options bar: a freehand mode will show a blue square as the cursor, whereas a drawing mode will show a red square as the cursor (see the left image in the figure). Figure 2-10. To create a path, hold down the SHIFT key and click. The Pen tool can also create a close path, and it can restrict all
