Photoshop Elements is a perfect introductory program for those who just want to play around with images. It's a beginner-friendly program, and it can handle thousands of layers, handles images up to 10MB in size, and packs an array of basic image-editing tools. But it's on the rather meager and buggy side for true image-editing professionals. I talk more about Photoshop Elements in Chapter 11. Figure 3-2 shows a layer mask in the bottom right corner of a 600dpi (dots per inch) image from the original Digital Photo Professional software. A selection (the black circle) is made in the image, which is then pasted to its own layer. A layer mask for the image is created with the Lasso tool, and when you move the mouse cursor over the mask, a red border appears around the selected area. This layer mask allows you to get rid of some of the background by painting in the mask over those areas. You can even paint in the mask with different colors for different areas to produce somewhat of a painting effect. **Figure 3-2:** The most basic of masks. Applying masks to individual images You can apply masks to individual images in Photoshop. This feature can be handy if you create a lot of images and want to modify only a few without opening a new document. Before you jump into using this feature, you should first understand how masks work. Photoshop uses the concept of a mask to define or erase regions of an image. This allows you to edit, add, or remove portions of an image without affecting the rest of it. Creating a mask To create a mask, you must first paint an outline over the portion of an image that you want to use as a mask. To do this, select the image layer that you want to work with and then click the Create New Mask button on the Layers panel or choose Create a New Mask from the Mask panel's drop-down menu, shown in Figure 3-3. You can also access this menu option by choosing Layer Mask from the Layer Mask panel's drop-down menu. When you create a new mask, Photoshop creates a layer and associates it with the image. This layer is then updated automatically. You can move or copy this layer just

like any other layer. This means that all the properties of the mask are also associated with the original image. These properties include the Blend Mode, Opacity, color, and alpha
